“ CAMPUS HUB ”

Process Model:

Developing any software at a small scale “ **Agile** ” methodology is a suitable choice.

Principles of Agile:

- ✓ **Customer Involvement**
- ✓ **Incremental Delivery**
- ✓ **Embrace Change**
- ✓ **Maintain Simplicity**

Using Agile for small-scale development is efficient because Agile process Model provides:

1. Flexibility:

Agile provides flexibility because developers can make the software efficiently in small sprints called “iterations”. This helps in making a working product faster and according to user feedback.

2. Customer Collaboration:

As discussed earlier it requires more user involvement, which can be helpful in refining the product timelier and more efficiently.

3. Quick Delivery:

Instead of delivering the whole product at once. Agile offers delivery of core modules earlier and then adding further advanced features.

4. Resource Efficiency:

For small teams or projects with limited resources , Agile help us to prioritize features based on importance , ensuring the most valuable parts of the LMS are delivered first.

Process Flow in Agile:

- **Initial Planning :**

Define the basic requirements (admin responsibilities, teacher responsibilities, student responsibilities etc.).

- **Iterations/Sprints :**

Develop the software in small cycles. Each sprint may focus on delivering a specific part of the software (e.g., login system in one sprint, course creation in another).

- **Feedback Loop :**

After each sprint, get feedback from the users (teachers, administrators) to refine the next iteration.

- **Testing :**

Continuous testing is integrated within each sprint to ensure each part is functional before moving to the next.

Agile Method:

Scrum is an agile method that focuses on managing iterative development rather than specific agile practices.

Scrum will be used because :

1. It requires a smaller team (<10 people)
2. Duration of one sprint is small
3. The increments are visible and usable
4. It is time boxed

Benefits of using scrum :

- Increase employee productivity and happiness
- Improve product quality
- Reduce time to market
- Enhance stakeholder satisfaction

The Process Flow:

- 1. Start with a Product Backlog :**

The Product Owner will create and prioritize the backlog.

- 2. Sprint Planning :**

The team will select items from the backlog for the upcoming sprint.

- 3. Execution :**

The team will work on the selected items, meeting daily for stand-ups.

- 4. Review and Feedback :**

At the end of the sprint, the team will share their progress with each other and discuss any problems faced

- 5. Reflect and Improve :**

The team will discuss what worked and what didn't during the sprint retrospective.

- 6. Repeat :**

The process will continue with the next sprint, incorporating feedback and improvements.

Scrum Roles:

- 1. Product Owner**

Hoor Spogmay

- 2. Scrum Master**

Aqsa Ahmed

- 3. Scrum Team**

- Aqsa Ahmed
- Hoor Spogmay
- Simaab Malik

Division of Responsibilities:

❖ **Aqsa Ahmed :**

Responsible for data collection and analysis.

❖ **Simaab Malik :**

In charge of content management and resource coordination.

❖ **Hoor Spogmay :**

Oversees the finalization of the the artifact.

Conclusion:

Scrum is a powerful framework that helps teams navigate the complexities of project management, particularly in dynamic environments like software development. By emphasizing collaboration, adaptability, and continuous improvement, Scrum enables teams to deliver high-quality products that meet user needs effectively.
